

What to do to Integrate Amateur-Astronomers to the „Lucky Star“?

Publishing the Results of the Conference:

- Describing the goals and possible data to be achieved
- Asking for interested observers and their telescopes to create a list of it all
- Using as much as possible different amateur journals including this content

Integration of Observers using a comparable kind of measurement-devices for:

- Determinations of minor-planet positions
- Period-Determinations of short-period variable stars

Derives that can be lent:

- GPS-Timer (position-determination must be included)
- CCD-Cameras
- Telescopes

Training for not Occultation-Experienced Amateurs:

- Creating handouts
- Training on the job
 - How to find a faint star
 - How to use the devices
 - Check-list

What else ...

To receive as soon as possible next year's prediction, for amateurs still have to work for their income! They have to plan their holidays and would like to know the date and a rough description of the possible occultation-area.
